

SETUP APTANA

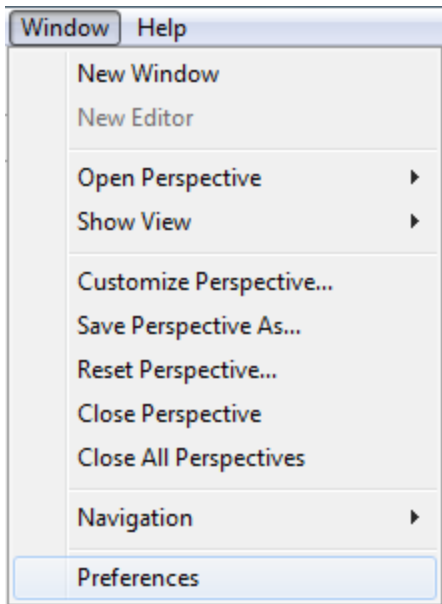

WebLabUX

Download Aptana Studio

- You can download the latest version for MAC or PC here:
 - <http://www.aptana.com/>

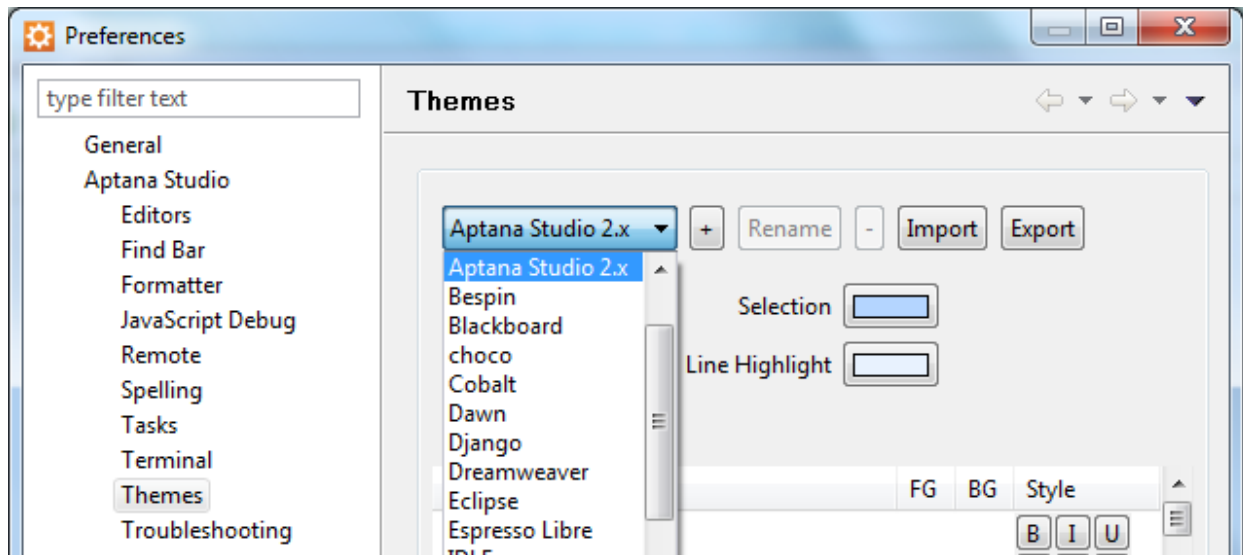

Changing the Look

- By default Aptana Studio 3 gives you a black background with white text ontop. If you'd like you can change the look:
- go to Windows -> Preferences

Changing the Look

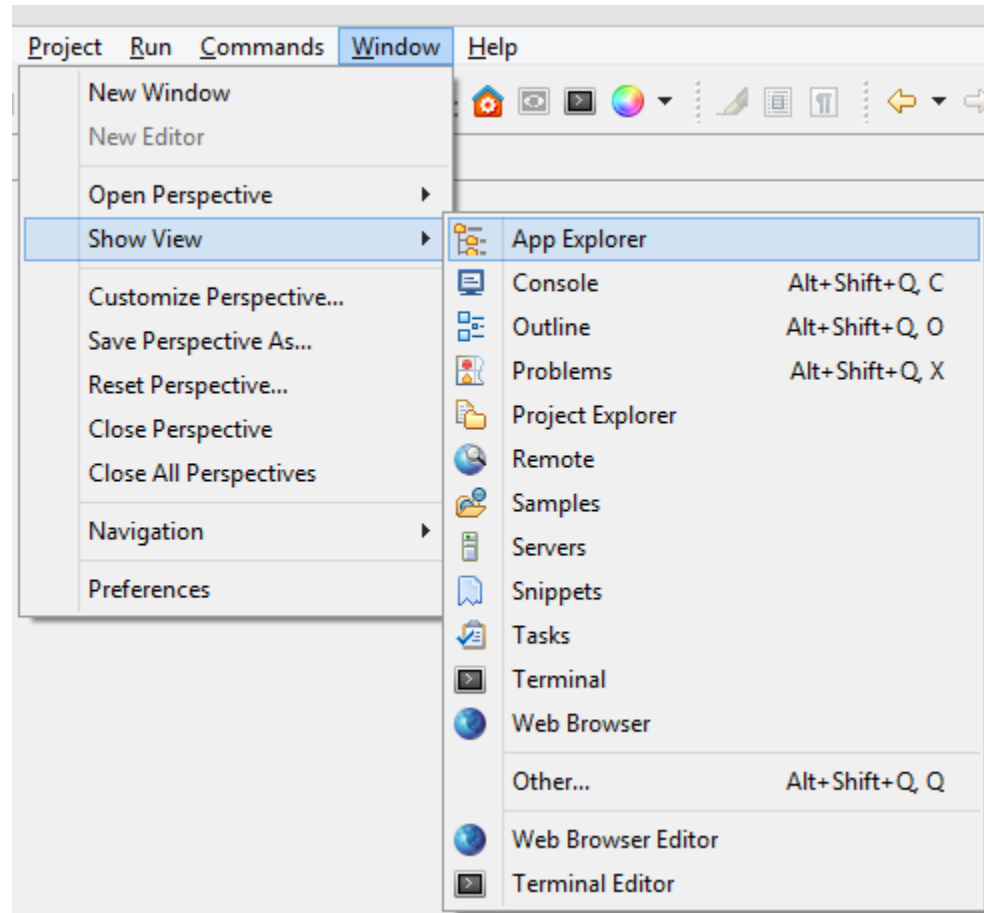

- Now you can pick your theme, I choose Aptana Studio 2.x

- Click Apply and Ok.

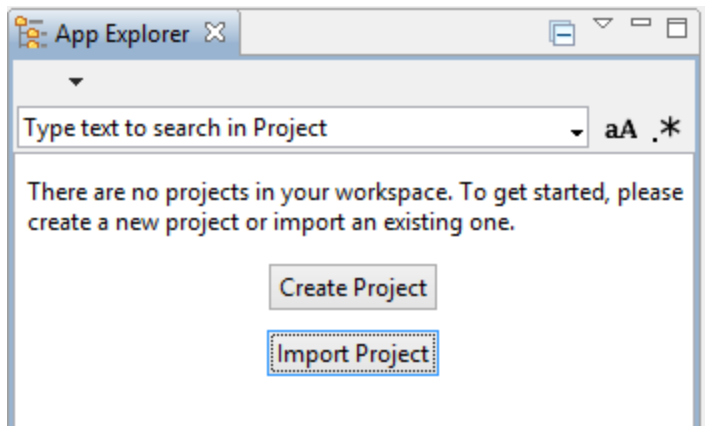

Using git in Aptana

- First make sure you've already setup git on your machine
- Now open the App Explorer:
 - Windows
 - > Show View
 - > App Explorer

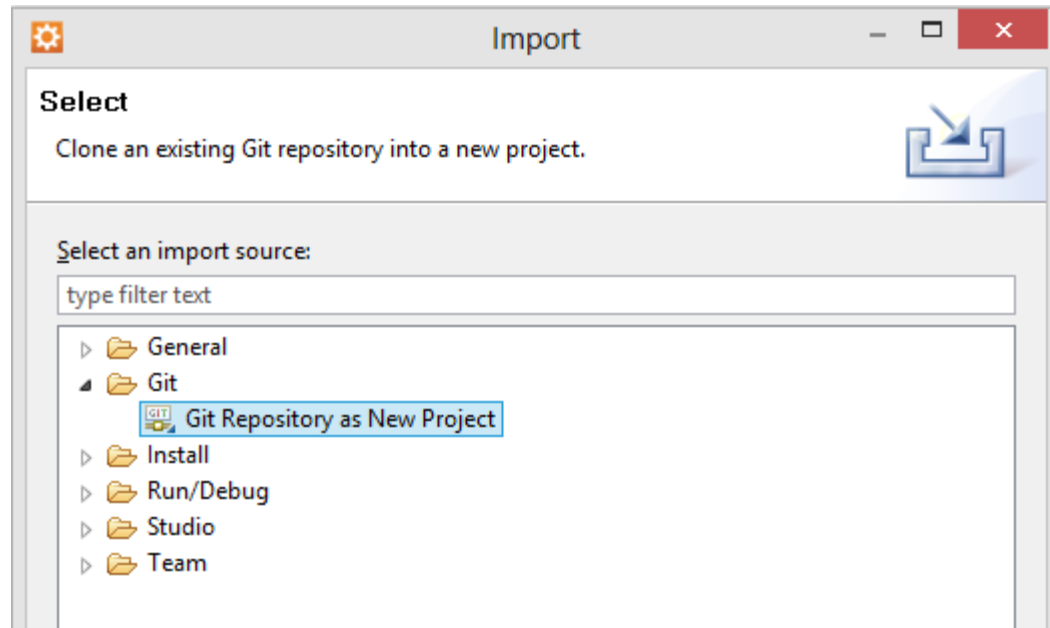

Create Project

- Click Import Project to clone your project

Create Git Project

- Select:
 - Git -> Git Repository as New Project

Pick your repository

- Now pick your repository you want to clone, and put the git address as the uri.
- Get the git address from the repository in github;

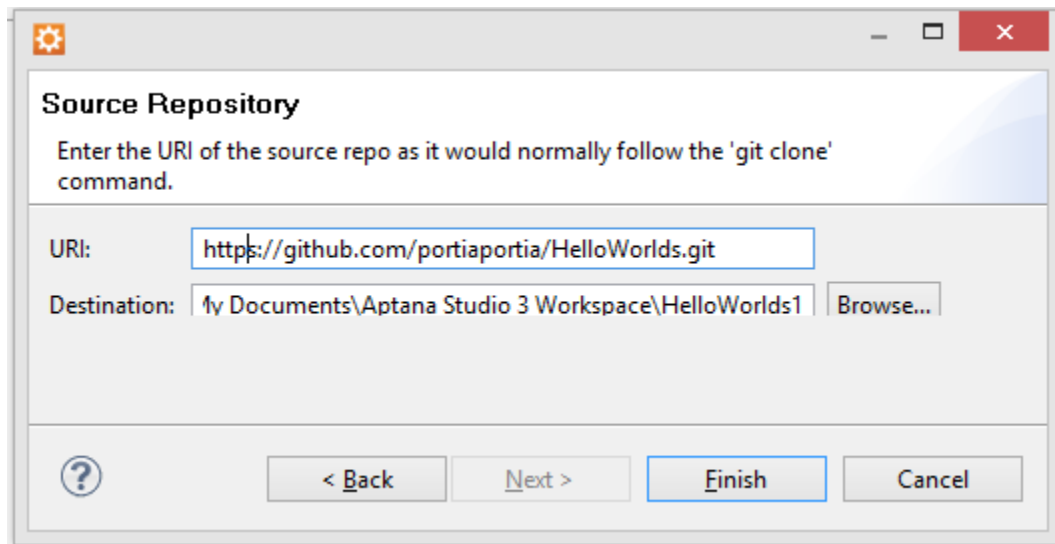

HTTPS clone URL

`https://github.co` 

You can clone with HTTPS, SSH,
Subversion, and other methods.

Set up your uri in Aptana

- Copy in the clone uri
- Make sure your destination is desirable
- And finish

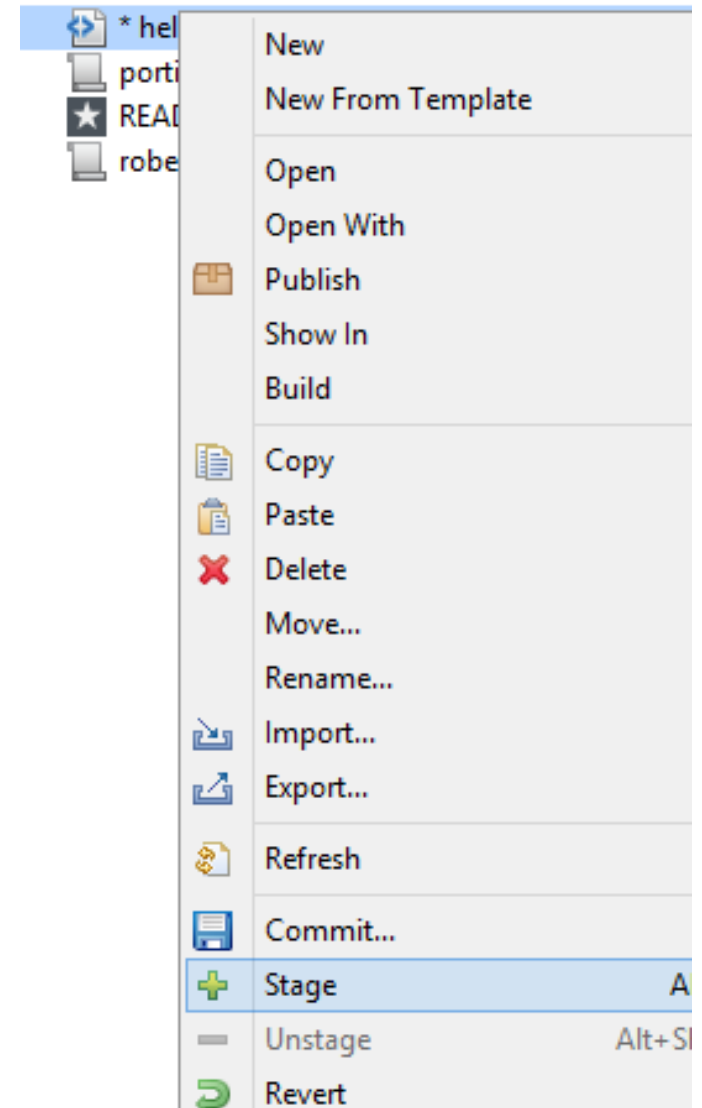

Open Your Project

- Now you can open your project to view your files and begin working.

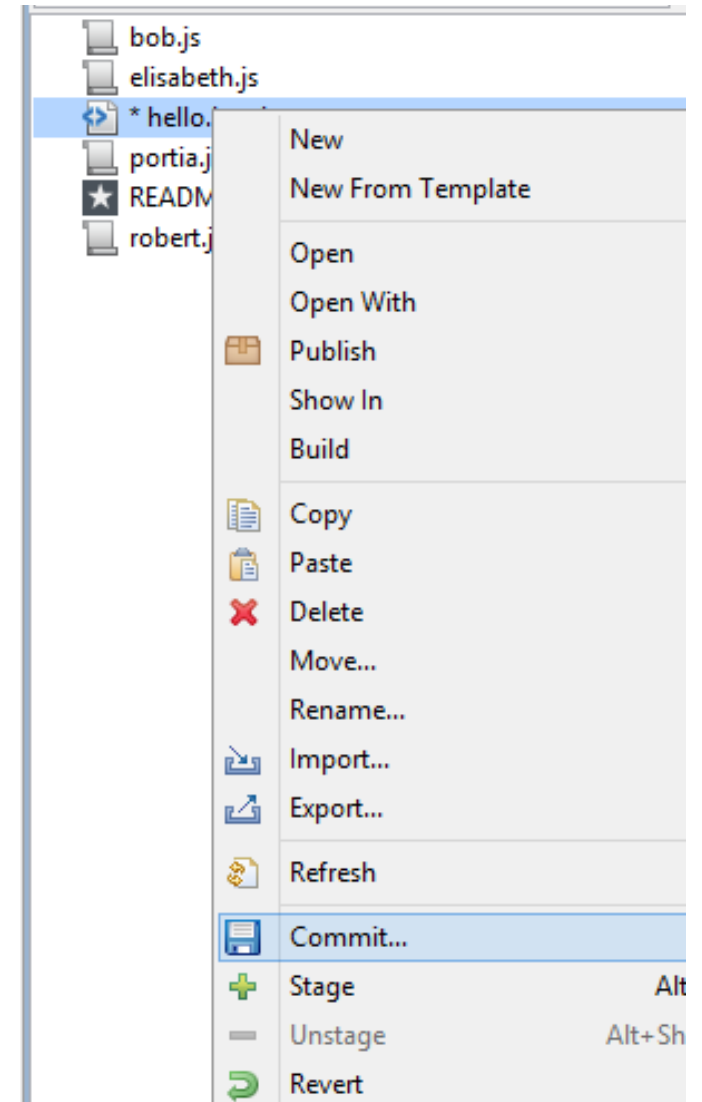

Making Changes

- Once you make and save changes to a file, the file will be highlighted in red.
- To get a file ready to be committed you will have to stage it.
 - Right click on the file and pick 'Stage'

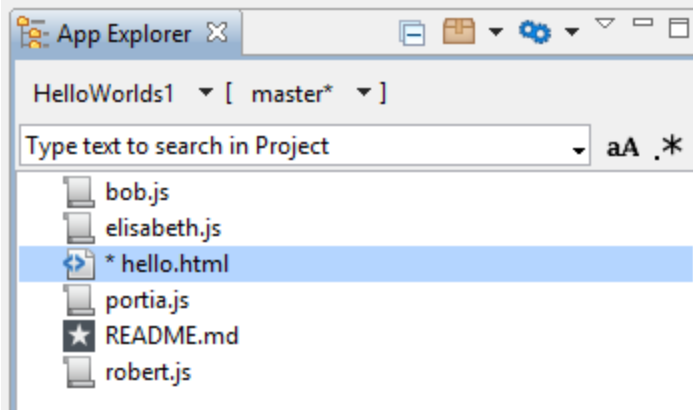

Committing

- Once you've staged all the files that you want to commit, then commit
- Right click and pick 'Commit'

Pushing

- To push your commits to git, you will need to go to the gear at the top of the App Explorer

- Click Push from the Menu
 - Enter your git username and password
- And that's it 😊
